Indar Electric, an Ingeteam company, has worked for over 75 years in the design, manufacture and supply of electrical rotating machines.

Internal Combustion Engine (ICE) business unit

Our aim is to contribute towards a flexible generation that provides cost- and reliability-generating electricity with the highest efficiency whenever it is necessary, on land, at sea or even in remote and decentralized locations.

Our Human and technical resources such as its state-of-the-art power electronics and rotating machine laboratory are a reflection of the current leading position of INDAR in the global market. Its powerful design human team and production centers located in Milwaukee (USA) and Beasain (SPA), together with their clear vision to serve the specific managed projects, make INDAR an option as no other.

Internal Combustion Engine (ICE) business unit takes the lead on the promotion of the generators to be coupled and fully adapted to the demands of reciprocating engines, serving the generation projects of any end user such as power utilities, IPPs, PPA operators or municipal or industrial cogeneration plants among others.

Our aim is to contribute towards a flexible generation that provides cost- and reliability-generating electricity with the highest efficiency whenever it is necessary, on land, at sea or even in remote and decentralized locations.

At Indar Electric the quality of our products and services, respect for the environment, and occupational hazard prevention are all essential to our work. With this in mind, we have achieved management systems certification in compliance with the ISO-9001, ISO-14001 and OHSAS-18001 international standards, with the aim of establishing continuous improvement bases on the involvement of all parties.

Cooperation with the client forms part of the philosophy of the company, with a personalized and unique treatment forming the basis of the relationship, and with a clear common purpose.

To develop products and services adapted to the characteristics of each project and client. For this purpose the R+D+i support unit is made up of highly qualified personnel and has the most advanced computer resources for the design and development of generators.

The main philosophy of INDAR is to guarantee the quality and the reliability with in-house fully proven solutions. To this respect INDAR has one of the best test benches in the world. The main capabilities are:

- On load tests up to 9 MW.
- Back to back configuration testing up to 65 MW.
- UVRT (low voltage ride through) capability.
- Self generated grid of 50/60 Hz 20 MVA.
- Combined tests of electrical and thermal insulation ageing.
- Climatic chamber (-30ºC to 80ºC) extreme ambient conditions.
- LVRT (low voltage ride through) testing capability.

INDAR counts with a wide experience in developing static and dynamic grid code compliant generators. The combination of INDAR's technology and knowledge, together with a close cooperation with the customer, is the only way of ensuring that the complete installation complies with the complete grid code regulations.

Features

- Optimization of efficiency, up to 98.1% at cosPhi:0.8 and 98.5% at cosPhi=1
- Project specific: Taylor made solutions according to customers specifications.
- Standardization development capability.
- Special applications development capability, such as: Nuclear Power Plant (Emergency Diesel and Ultimate Emergency Diesel) generators, synchronous compensators, rotating frequency converters, anti-shock compliant generators, generators coupled to 2-stroke low speed engines.
- Compliance with international standards: IEC, IEEE, NEMA, etc.
- Negotiated quality control plan.
- Vibration level withstand capability according to engine manufacturer.
- Worldwide service network.
- Operation & Maintenance training courses.

World class testing facilities
